Carbon Emission Tracking and Environmental Compliance System for Industries

DSA0104 - Object Oriented Programming With C++

Guided By:
Dr. Devan

Presented by:
Harshavardhan R V (192472163)
Nawab Saad (192472266)
B. Pranay Deep Chowdary (192472177)
Pavan Jana (192472313)

INTRODUCTION

- Industries use fuel and electricity for their daily operations.
- These activities produce carbon dioxide (CO₂) emissions.
- Monitoring carbon emissions is important for protecting the environment.
- Manual calculation and record keeping can be difficult.
- Our project develops a C++ system to track industrial emissions and check environmental compliance.

OBJECTIVES

- To collect industrial activity data.
- To store and manage emission-related data.
- To calculate CO₂ emissions.
- To track emissions over time.
- To compare emissions with environmental limits.

PROBLEM STATEMENT

- Industries generate carbon emissions from different activities.
- Emission data may be stored manually or in separate files.
- Calculating total emissions manually can cause errors.
- It is difficult to continuously track emission levels.
- Industries need to know whether their emissions are within permitted/reference limits.

Literature Review

S. No	Author(s) & Year	Focus Area	Methods Used	Key Findings	Research Gap
1	Adhikari et al., 2025	Carbon Footprint Tracking in Industries	IoT sensors, AI analytics, cloud monitoring	Real-time monitoring improves emission measurement and sustainability.	Limited integration with regulatory compliance and automated reporting.
2	Striletskyi, 2024	Enterprise Greenhouse Gas Emission Management	Emission monitoring algorithms, data analytics	Automated systems improve greenhouse gas tracking accuracy.	Lacks predictive analytics and intelligent decision support.
3	Cenci & Biffis, 2025	Greenhouse Gas Reporting Standards	Emission reporting framework, comparative analysis	Standardized reporting enhances environmental transparency and compliance.	Limited support for continuous real-time industrial monitoring.
4	Alzoubi et al., 2026	Carbon Footprint Monitoring and Privacy	Carbon monitoring tools, privacy risk assessment	Secure monitoring systems improve trust in environmental data.	Insufficient focus on industrial compliance automation and alerts.
5	IEEE Standards Association, 2025	Blockchain-Based Carbon Emission Management	Blockchain, distributed ledger, secure data sharing	Blockchain improves transparency and tamper-proof emission records.	Limited deployment in large-scale industrial environmental monitoring.

System Architecture

CARBON EMISSION TRACKING AND ENVIRONMENTAL COMPLIANCE SYSTEM FOR INDUSTRIES

— SYSTEM ARCHITECTURE —

LIST OF MODULES

1. Industrial Data Management Module
2. Carbon Emission Calculation & Tracking
3. Environmental Compliance and Reporting Module

MODULES 1: Industrial Data Management

- Collects industry details.
- Records fuel consumption.
- Records electricity consumption.
- Records production/activity data.
- Stores environmental data.
- Allows searching and updating records.

Module 2: Carbon Emission Calculation & Tracking

- Takes activity data from Module 1.
- Applies emission factors.
- Calculates CO₂ emissions.
- Calculates total emissions.
- Tracks monthly and yearly emissions.
- Identifies high-emission activities.

Module 3: Environmental Compliance & Reporting

- Takes calculated emissions.
- Compares emissions with a reference/environmental limit.
- Determines compliance status.
- Identifies excess emissions.
- Generates warnings.
- Generates reports.

FUTURE SCOPE

- Add advanced emission prediction using historical data.
- Support multiple industrial emission factors and standards.
- Develop graphical dashboards for emission visualization.
- Add database integration for large-scale data storage.
- Extend the system for automated compliance monitoring

CONCLUSION

- Our project provides a C++-based system for tracking industrial carbon emissions.
- It collects fuel, electricity, and other activity data from industries.
- The system calculates CO₂ emissions using emission factors and stores the results.
- Monthly or yearly records can be compared track whether emissions increase or decrease.
- Finally, it generates emission reports, compliance status.
